180 million year old Whitby / Yorkshir dinosaur coast fossil ammonites (Lot 250)

North Yorkshire boasts some of the most stunning countryside and amazing seaside anywhere in England, and its history is equally dramatic. Whitby Museum holds evidence of the great sea creatures that formerly populated this region millions of years ago. The soft shale rocks reveal and release fossils of remarkable sealife from small ammonites to giant plesiosaurs. This is truly the 'Dinosaur Coast'. From the southern areas around Filey to the far north of our story at Saltburn-by-the-Sea, each area has its own tales to tell. Within these pages, we take a journey in words and full-colour pictures along Yorkshire's Dinosaur Coast. Discover the twentieth-century seaside resorts of Filey and Scarborough and the secret cliffs of Robin Hood's Bay. Visit the home of Dracula, the fishing villages of Staithes and Runswick Bay, and stand on the pier at Saltburn to watch the great ships that still service the area's industry. Wildlife, history, heritage and landscape combine to make the northern coastline of Yorkshire a fascinating place to visit. This is Yorkshire at its best.

This monograph presents the state of art of the geologic knowledge about the Spanish coast obtained through scientific research in the last 30 years.From a general point of view, coasts are the most quickly changing systems of the Earth. This is critical, since many human resources, such as the main part of economic and social activities, are located in the coastal areas. Especially in the case of Spain these coasts include cities, wide industrial areas (including harbor complexes), important ecologic systems, and our main economic resource: tourism. Understanding the dynamic functioning of each element of this coast is vital for correct future coastal management, so as to solve problems derived from bad plans developed in the last decades of the twentieth century. This is a valuable text for advanced graduate students and coastal researchers, which connects the specific dynamic functioning of the main Spanish coastal environments and their relationships with human activities.

The discovery of dinosaurs and other large extinct saurians - a term under which the Victorians commonly lumped ichthyosaurs, plesiosaurs, pterosaurs and their kin - makes exciting reading and has caught the attention of palaeontologists, historians of science and the general public alike. The papers in this collection go beyond the familiar tales about famous fossil hunters and focus on relatively little-known episodes in the discovery and interpretation (from both a scientific and an artistic point of view) of dinosaurs and other inhabitants of the Mesozoic world. They cover a long time span, from the beginnings of modern scientific palaeontology in the 1700s to the present, and deal with many parts of the world, from the Yorkshire coast to Central India, from Bavaria to the Sahara. The characters in these stories include professional palaeontologists and geologists (some of them well-known, others quite obscure), explorers, amateur fossil collectors, and artists, linked together by their interest in Mesozoic creatures.

The latest advances in dinosaur ichnology are showcased in this comprehensive and timely volume, in which leading researchers and research groups cover the most essential topics in the study of dinosaur tracks. Some assess and demonstrate state-of-the-art approaches and techniques, such as experimental ichnology, photogrammetry, biplanar X-rays, and a numerical scale for quantifying the quality of track preservation. The high diversity of these up-to-date studies underlines that dinosaur ichnological research is a vibrant field, that important discoveries are continuously made, and that new methods are being developed, applied, and refined. This indispensable volume unequivocally demonstrates that ichnology has an important contribution to make toward a better understanding of dinosaur paleobiology. Tracks and trackways are one of the best sources of evidence to understand and reconstruct the daily life of dinosaurs. They are windows on past lives, dynamic structures produced by living, breathing, moving animals now long extinct, and they are every bit as exciting and captivating as the skeletons of their makers.
