power at 2,300 RPM is 250, but that the engine is putting out about 380 HP at that same speed. What happened to the missing 130 horse-power? The answer is that the engine isn't generating it. A diesel engine's power at any RPM is controlled by how much fuel is metered into the injectors.

HP= (Torque x RPM)/5250. You can measure torque and RPM and you have to calculate the Horsepower (HP) from them and not vice versa. A typical engine performance curve is shown
